Lab #4 Methods

Create a console-based program named Commission. Its Main() method calls two other methods:

1- The first method to be called should ask a salesperson for the dollar value of daily sales and return the entered value to the Main() method.

2- The second method to be called should calculate the salesperson's commission based on the rates in the following table.

Sales	Commission
$0 to $999	3%
$1000 to $2999	4%
$3000 and up	5%

The dollar value of the calculated commission should be returned to the Main() method, which then displays the value in the console.

No need to record video for this. Just zip it and upload to eCentennial under Lab 4.
